ABSTRACT

This report summarizes test performance for 771,031 students tested on Armed Services Vocational Aptitude Battery (ASVAB) Form 2 during school year 1973-74, with separate normative tables provided by sub-test, aptitude composite, grade, sex and geographic region. New data are provided for ninth grade and post-high school students. Information contained in the tables parallels percentile scores reported for individual students to be tested with ASVAB in school year 1974-75. Percentile tables in the present report are designed for use by high school counselors as an interpretative guide and a supplemental reference to the AFVTG computer printout of student test scores. Users are cautioned that 1974-75 represents the first time ASVAB percentile scores are to be computed around empirically developed student norms rather than representative service derived mobilization population samples. As such, the data are not representative of the total available high school population, but do characterize actual test performance of students examined during the preceding year's test cycle. Additionally, where individual test score comparisons from one year to the next may be required, the 1974-75 ASVAB percentile reports will represent different levels of student performance over previous reports (i.e., prior to September 1974). APPROVED FOR PUBLIC RELEASE; DISTRIBUTION UNLIMITED

Armed Forces Vocational Testing Group Technical Research Reports and Technical Research Notes are developed for primary use and reference by secondary school counselors and Department of Defense Armed Services Vocational Aptitude Battery (ASVAB) test administrators and educational specialists. This report is presented in a format to facilitate ready interpretation and use on the part of counselors and field testing and educator personnel. Conclusions and recommendations are solely those of the primary authors and in no way represent either official policy of the military services or the Department of Defense.

20. ABSTRACT (Continue on reverse side if necessary and identify by block number):

A previous report (Wilfong and Armstrong, 1974) summarized empirical norms for 870,000 students tested on the Armed Services Vocational Aptitude Battery (ASVAB) Form 1, during school year 1972-73. The current report summarizes test performance for 771,031 students tested on ASVAB Form 2 during school year 1973-74, with separate normative tables provided by sub-test, aptitude composite, grade, sex and geographic region. New data are provided for ninth grade and post-high school students.

DD FORM 1 JAN 73 1473 EDITION OF 1 NOV 65 IS OBSOLETE

20. ABSTRACT (CONTINUED)

Information contained in the tables parallel percentile scores reported for individual students to be tested with ASVAB in school year 1974-75. Percentile tables in the present report are designed for use by high school counselors as an interpretative guide and a supplemental reference to the AFVTG computer printout of student test scores.

Users are cautioned that 1974-75 represents the first time ASVAB percentile scores are to be computed around empirically developed student norms rather than representative service derived mobilization population samples. As such, the data are not representative of the total available high school population, but do characterize actual test performance of students examined during the preceding year's test cycle. Additionally, where individual test score comparisons from one year to the next may be required, the 1974-75 ASVAB percentile reports will represent different levels of student performance over previous reports (i.e., prior to September 1974).

PREFACE

A primary responsibility of the Research Division, Armed Forces Vocational Testing Group, is the publication and distribution of interpretative data associated with administration of the Armed Services Vocational Aptitude Battery (ASVAB). Data contained in the tables of this report summarize test results for 771,031 students tested on ASVAB, Form 2 only, during school year 1973-74. These tables are designed as a basic supplement to the technical appendix contained in the High School Counselor's Manual (DOD 1304.12X, 1973-74 edition).

Data contained in this report are intended for release to and application by high school ASVAB users. Normative data contained herein parallel individual student test results, reported in percentiles, as printed on the counselor's copy of the ASVAB computer printout for school year 1974-75.

The tabular information contained in this research note has been extracted from the ASVAB historical tapes maintained by the Computational Sciences Division, Air Force Human Resources Laboratory, AFSC, Lackland Air Force Base, Texas.

This technical research note has been conducted as a subpart of AFVTG research project unit 100, under guidelines prescribed through Department of Defense Instruction 1304.12 (December 1972).

ABSTRACT

A previous report (Wilfong and Armstrong, 1974) summarized empirical norms for 870,000 students tested on the Armed Services Vocational Aptitude Battery (ASVAB) Form 1, during school year 1972-73. The current report summarizes test performance for 771,031 students tested on ASVAB Form 2 during school year 1973-74, with separate normative tables provided by subtest, aptitude composite, grade, sex, and geographic region. New data are provided for ninth grade and post-high school students.

Information contained in the tables parallel percentile scores reported for individual students to be tested with ASVAB in school year 1974-75. Percentile tables in the present report are designed for use by high school counselors as an interpretative guide and a supplemental reference to the AFVTG computer printout of student test scores.

Users are cautioned that 1974-75 represents the first time ASVAB percentile scores are to be computed around empirically developed student norms rather than representative service derived mobilization population samples. As such, the data are not representative of the total available high school population, but do characterize actual test performance of students examined during the preceding year's test cycle. Additionally, where individual test score comparisons from one year to the next may be required, the 1974-75 ASVAB percentile reports will represent different levels of student performance over previous reports (i.e., prior to September 1974).

PERCENTILE NORMATIVE TABLES FOR THE ARMED SERVICES VOCATIONAL APTITUDE BATTERY (1973-74 SCHOOL YEAR DATA BASE)

I. INTRODUCTION AND BACKGROUND

The initial standardization sample used in computation of norms for the Armed Services Vocational Aptitude Battery (ASVAB) as described in Bayroff and Fuchs (1970) has been used as a basis for percentile conversions of raw score data from 1968 through school year (SY) 1972-73. During this same time frame, the version of the battery used operationally in the Department of Defense High School Testing Program was ASVAB-Form 1. A description of each of the nine subtests (i.e., aptitude scales) comprising the battery is summarized in Appendix 1.

Form 2 of the ASVAB was introduced into the high school testing program in September 1973, and was the basic battery in use during SY 1973-74. The primary objective of this report is to summarize reference statistics, in tabular format, on Form 2 of the ASVAB based on actual student samples tested during SY 1973-74.

A. **Contrast between Forms 1 and 2, ASVAB.** Based primarily on research findings using unrestricted samples of Navy recruits (Thomas, 1970), items for inclusion in Form 2 - as extracted from pre-existing item pools - were selected around a decreased level of difficulty

Table 1

DISTRIBUTION OF $\underline{p}$ VALUES FOR ASVAB, FORM 1, FOR AN UNRESTRICTED SAMPLE OF NAVY RECRUITS (N = 2,274) *a

Sub-test	Number of Items by Value Range								Mean $\underline{p}$ Value
	20-29	30-39	40-49	50-59	60-69	70-79	80-89	90-99

(i.e., p-values) in relationship to Form 1. Ranges of p-values represented in the Form 1 version of the battery are shown in Table 1.

There are two subtests in Form 2 where the revised difficulty levels as recommended by Pat Thomas (1970) were not applied: Coding Speed (CS), because of its speeded nature renders establishment of individual item p-values unnecessary, and/ the difficulty level of the Word Knowledge (WK) subtest was, conversely, increased to improve both usable test variance and face validity.

It is essential that the ASVAB user understand the underlying nature of these differences between the two forms of the battery because year-to-year normative scales and individual scores change accordingly. In both cases, the content of the scales (viz. aptitude dimensions measured) and the scoring formulae (Rights minus 1/3 Wrongs except for the Coding Speed subtest) remained constant.

B. **Computation of Composite Percentiles**. An additional administrative change was affected to the computerized scoring routine which also had a definite, but limited, impact upon ASVAB score distributions between SY 1973-74 and SY 1974-75. Due to the availability of empirical norms of actual student performance by grade, computation of percentiles for reporting to counselors and students was modified to an actual percentile equation system - by grade and sex - *built around the tables shown in this research note.* Table 2 shows composite computational formulae previously used during SY 1973-74 and earlier, and the new formulae, implemented in September 1974 for comparative purposes. The statistical impact of application of the new equations is to slightly compress each distribution around the mean (when compared to compositing formulae applied before September 1974).

Table 2

HIGH SCHOOL APTITUDE CONVERSION FORMULAS

Composite	SY 1973-74	SY 1974 +
(EL) Electronics	$\frac{2EI(\%) + MC(\%)}{3}$	2EI + MC
(GM) General Mechanical	$\frac{2SI(\%) + SP(\%)}{3}$	2SI + SP
(MM) Motor Mechanical	$\frac{2AI(\%) + MC(\%)}{3}$	2AI + MC
(CL) Clerical	$\frac{WK(\%) + CS(\%)}{2}$	$WK + \frac{CS}{3}$
(GT) General-Technical	$\frac{WK(\%) + AR(\%)}{2}$	WK + AR

II. METHOD OF SAMPLING

Since the decision was made to build reporting percentiles around empirical norms established for each preceding school year; by definition, the sampling population consisted of all students tested on ASVAB. In turn, the school in which ASVAB was administered became the individual sampling unit. Conditions under which the ASVAB was administered varied from school to school as follows: required testing of all students, grades nine through 12; testing of only seniors interested in vocational careers; voluntary testing of only those students interested in pursuing a military career; or testing of male seniors only. The most frequently occurring, and the preferred mode of administration was testing of all students, male and female, in grades 10 and 12; with the senior administration representing a retesting of sophomores previously examined with the battery.

As a result of these differing modes of testing, few, if any, inferences can be drawn concerning the level of individual student motivation to perform at optimum levels on the battery. It is known that value of the results to the individual is strongly stressed during the standardized ASVAB test administration instructions and participation on the part of each student is strictly voluntary in accordance with Department of Defense policy.

The distribution of sampling units (i.e., schools) and students tested by grade by state are shown in Table 3.

TOTAL	10783	59426	148607	209045	415730	5986	(872493)

*a Total row values are not summation of individual grades but include students tested whodid not indicate grade on the ASVAB answer card. Refer to footnote 1 for a detailed description of reasons for the difference between total students tested on ASVAB-2 (N= 872,493) and the 771,031 cases used in the sample(s).

During SY 1973-74, a total of 1,100,248 students were tested on both Forms (1 and 2) of the battery. Of this number, 872,493 (89.3%) were tested on Form 2. Of the students tested on Form 2, 476,017 (or 54.55 percent) were males.

Although test norms are reported for students in a post-high school status (the 12 + column in Table 3), caution must be exercised in generalizing these data to any nation-wide populations. A standard part of the ASVAB test administration instructions directs students to code the *last grade completed* on the answer card as the indicator of current grade level and some of the responses coded at the post-secondary level may represent

Table 4

NATION-WIDE TEST PERFORMANCE, STUDENTS TESTED ON FORM 1 (SY 1972-73) vs FORM 2 (SY 1973-74)

Subtest	Form 1 (72-73) N*a	Mean	SD	Form 2 (73-74) N	Mean	SD
Coding Speed	873626	48.56	15.02	771031	48.55	14.05

Arithmetic Reasoning	873645	12.18	5.99	771031	13.29	5.85
Tool Knowledge	873636	10.27	5.76	771031	10.98	6.17
Space Perception	873637	9.95	5.59	771031	13.45	5.69
Mechanical Comprehension	873637	11.35	4.85	771031	12.51	5.05
Shop Information	873635	9.77	5.46	771031	11.60	5.48
Automotive Information	873636	8.58	6.24	771031	11.48	5.20
Electronic Information	873628	10.08	5.85	771031	11.16	5.68

*a Numbers vary from subtest to subtest as a result of some few students failing to complete all portions of the battery. Only complete results were used in computation of means and standard deviations.

a genuine misunderstanding of standardized instructions. To a lesser extent, the same potential source of error variance impacts upon distributions reported for grades nine through 12.

III. RESULTS (DEVELOPMENT OF ASVAB REFERENCE TABLES)

Data summarized in the tables appended to Appendix 2 were constituted on the basis of 771,031[1] students tested on ASVAB (Form 2).

[1]The difference between total number of students tested on ASVAB-2 in SY 1973/74 (N=872,493) and number used in the norming sample (N=771,031) is a function of cases dropped because of student failure to code grade or sex on the answer card and termination of the norming group on 31 Mar 74 (i.e., students tested after 31 Mar 74 are not included in these data tables).

Differences between empirical norms for students tested on Form 1 (SY 1972-73) and Form 2 (SY 1973-74) are summarized in terms of overall subtest means and standard deviations in Table 4. Most of the difference between the two samples is a function of "engineered" redistributing of item difficulties resulting from recommendations contained in Thomas, 1970, (op. cit.) and submitted by other service researchers.

Information shown in Tables 1 through 19 (Appendix 2) are characteristic of all students tested - by subtest and composite - on the battery during the preceding year's test cycle. The resultant percentiles are not a random representation because the 771,031 students tested did not accurately reflect *all* strata of any

nation-wide population who might be expected to eventually take ASVAB, but they are true empirical norms.

Tables in Appendix 2 are:

Tables 1-9: Show raw score to percentile conversions by subtest recorded by grade and sex. Separate conversions are recorded by: grade and sex, overall grade, and total national percentiles.

Tables 10-14: Reflect the same information as shown in Tables 1 through 9, but report percentiles for each of the five ASVAB composites. Actual scores reported on the student record portion of the gummed label printout provided by AFVTG to high school counselors are extracted from these tables. Data in Tables 1 through 14 serve as the norming base for constitution of the counselor's portion of the gummed label printout.

Table 15: Shows raw score to percentile conversions on subtests and composites for ninth graders and post-high school graduates only. As indicated earlier, caution should be used in generalizing from these data to any nation-wide populations. It is further stressed that applicability of ASVAB at the ninth grade level has yet to be established.

Tables 16-17: Show overall means and standard deviations by subtest and composite by geographic grouping for grade and sex. To the extent that prescribed geographic regions represent competitive labor markets, these data are expected to serve as an overall occupational "expectancy" norming referent. The groupings of states in each of the ten regions were defined in accordance with the first number in the five-digit zip code system prescribed by the US Postal Service. This process was used primarily due to the simplicity in extracting data from historical ASVAB computer banks[2].

[2]Separate raw score to percentile conversion tables have been prepared for geographic region to display information - by region - as shown in Tables 1 through 14 in Appendix 1. These tables are available from the Armed Forces Vocational Testing Group upon request.

Tables 18-19: Report subtest and composite means and standard deviations by grade and sex for nation-wide samples.

IV. INTERPRETATION

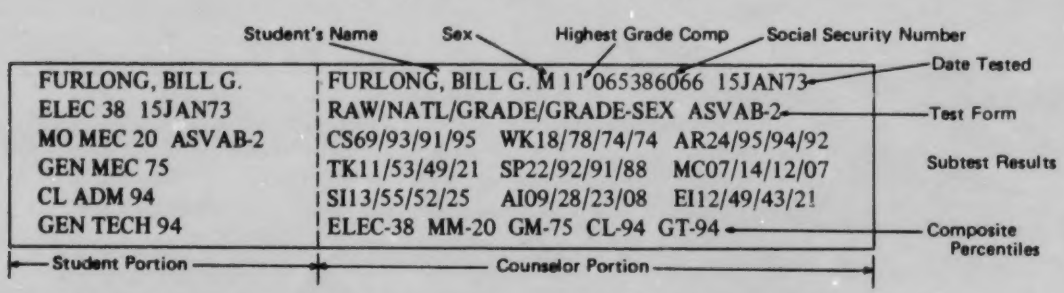
The ASVAB percentile tables summarized in this report are not self-interpreting, in that the manner in which a test score is reported to a student represents a descriptive rather than an absolute indicator of aptitude performance.

Percentile tables do indicate levels of achievement relative to known samples of students who have previously taken ASVAB. The data are also useful in defining the range of scores, extent of skewness, and areas of restricted variance. Users are referred to classical psychometric texts, such as Guion (1965), Cronback (1960), or Anastasi (1970) for a more complete discussion of normative interpretation.

A. **Subtest Scores**: As part of a programmed annual reissue of student ASVAB normative data, based upon samples tested during each preceding school year, both total sample N's and associated percentile scales are expected to display moderate fluctations. In this respect, yearly changes in this nation-wide standardized examination should be expected in successive AFVTG Technical Research Notes.

For this reason, the Armed Forces Vocational Testing Group supportive computer system used to report individual ASVAB test scores has been programmed to generate percentiles yearly against nation-wide performance on the complete battery during the preceding school year. As an example, the counselor/student report of subtest and composite percentiles (Figure 1) summarizes a student's ASVAB record (who was tested during school year 1974-75), computed against national norms derived from actual experience of test performance - across all students - during school year

COUNSELOR PRINTOUT GUIDE



APTITUDE COMPOSITES

ELEC	-	Electronics

TK	-	Tool Knowledge
SP	-	Space Perception
MC	-	Mechanical Comprehension
SI	-	Shop Information
AI	-	Automotive Information
EI	-	Electronics Information

Figure 1

1973-74 as *displayed in the tables contained in this report.* Similarly, percentile scores reported for individuals to be tested in SY 1975-76 will be based on empirically available norms computed upon 1974-75 ASVAB test performance for both subtest and composite scores.

Individual student ASVAB scores as reflected in Figure 1 are related to varying levels of nation-wide samples as follows (Sample sizes are shown in Tables 18 and 19, Appendix 2).

1. The first value reported for subtests is attained raw score where the computational formula is Rights minus 1/3 Wrongs (except for the Coding Speed subtest). These scores are presented for the benefit of those schools/districts/states desiring to transform attained values to other normative scales (e.g., Stanine scales, Z scales, normalized percentiles, and similar standardized scales).

2. The second reported subtest value is a percentile score based upon all individuals tested on ASVAB during the preceding school year. As mentioned previously, these percentile ranks embrace a range from ninth grade through junior college, technical institute, or community college.

3. The second percentile rank reported (i.e., the third value shown on the printout for each student) represents all individual scores by subtest, by grade. Since the majority of persons tested with ASVAB fall between grades 10 through 12, percentiles (Tables 1-14) are restricted to these levels.

4. The final score recorded for each student reflects nation-wide percentiles for both grade and sex. As a counseling aid, various combinations of tabled percentiles may prove useful in aiding students in career decision. For example, in

counseling an 11th grade female interested in possible entry into the Electronics field, it may be desirable to contrast her attained scores against percentile distributions for 12th grade males, since the latter group best represents a realistic pool of competitors for initial entrance into the labor market.

B. **Use of ASVAB Composites:** Occupational placement and vocational counseling are more efficiently accomplished on the basis of the results of several measurements in combination rather than on the score from a single scale (or subtest). The underlying rationale is that most occupations involve multiple combinations of aptitudes, skills, and abilities; that is, they are factorially complex, involving interaction of several different types of learning and environmental experiences. It is also emphasized that the initial conceptualization involved in formulating ASVAB (Bayroff and Fuchs, 1970) assumed that optimum validity for the battery would be best achieved through combination of subtests into composites. For these reasons, it is the aptitude composite that possesses maximum utility for student counseling; and, in turn, normative scales for the separate composites in this summary have the most valid basis for interpretation. Additionally, the various validity studies thus far conducted on ASVAB as related to criteria of academic (Harris and Huckell, 1974) or training (Vitola, Mullins and Croll, 1973; and Thomas, 1970, op. cit.) report validity on the battery only in terms of composite test performance. As an added aid to counselor interpretation, the following supplemental description of the five ASVAB student composites should be reviewed in relationship to specific percentile norms as reported in the various tables appended to this report.

1. **General Technical (GT):** As demonstrated by Harris and Huckell, op. cit., the general-technical composite best represents the student's capability for potential performance in occupational areas requiring overall academic ability. The composite is composed of unit weighting the Word Knowledge (WK) and Arithmetic Reasoning (AR) subtests of ASVAB. Males and females perform at essentially the same level, across all grade levels, on this composite.

2. **Clerical (CL):** This composite measures the student's ability relevant to performance in the range of clerical and administrative occupations. The composite consists of the Clerical Coding Speed (CS) and Word Knowledge (WK) subtests of the battery. On this composite it is to be noted that females consistently score higher than males.

3. **Electronics (EL):** This composite measures student skills in terms of abilities related to electrical/electronic knowledge to include electrical theory, schematics, and test equipment. The composite is computed from the Electronic Information (EI) and Mechanical Comprehension (MC) subtests. On this composite a distinct and significant difference ($p < .001$) existed between male and female test results, with males performing significantly higher.

4. **General Mechanics (GM):** This composite is correlated with performance requiring abilities in a variety of mechanical, skilled trades, and trade occupations (for sample vocational jobs refer to Volume II, DOD 1304.12Y, of the ASVAB Counselor's Manual). The GM composite consists of the ASVAB Shop Information (SI) and Spatial Perception (SP) scales. As with the EL composite, the GM composite shows consistent differences between male and female test performance.

5. **Motor Mechanics (MM):** This composite measures skills, knowledge, and achievement related to engine, automotive, and mechanical repair operations - and related jobs. It is composed of measures of Automotive Information (AI) and Mechanical Comprehension (MC). Again, males consistently possess higher mean scores than females.

As is the case with most nation-wide standardized aptitude test batteries, interpretation of ASVAB against locally developed and maintained test norms is highly encouraged. It is at the local level that student test data can be compared against other predictor variables such as actual classroom performance, outside activities, and similar noncognitive factors; all of which are essential to the individual guidance and counseling process.

Appendix 1

DESCRIPTION OF ASVAB SUBTESTS

TESTS IN THE ARMED SERVICES VOCATIONAL APTITUDE BATTERY (ASVAB)

1. **Coding Speed Test (CS).** In this test there is a key and 100 items. The key is a group of words with a code number for each word. Each item presents one word for which the examinee indicates the code number.

2. **Word Knowledge (WK).** Each item requires the examinee to select the correct synonym for a specified word.

3. **Arithmetic Reasoning (AR).** Each item is a reasoning problem involving application of the arithmetic process.

4. **Tool Knowledge (TK).** Each item presents five drawings of various tools or shop equipment. The examinee indicates which of the four alternative drawings goes best with the lead drawing.

5. **Space Perception (SP).** Each item consists of five drawings: A pattern and four boxes. The question to be answered is which one of the boxes can be made by folding the pattern.

6. **Automotive Information (AI).** Each item asks a question about the identification or operation of automobile parts.

7. **Shop Information (SI).** This test has questions about shop practices and the use of tools. Many of the items contain drawings.

8. **Mechanical Comprehension (MC).** Each item includes a drawing, or drawings, illustrating some physical principle and a question.

9. **Electronic Information (EI).** This test has questions about elementary principles of electricity and about electrical/electronic devices, drawings, and equipment.
